[†] In lab frame. Evaluators take a weighted average when multiple measurements of a $E(p)$ are available. [2007Do17](#) and [2015Su01](#) reported $E_{c.m.}$. [1997Tr05](#) and [2001Lo11](#) reported the $E(\text{level})$ of ^{36}K proton-emitting levels. Evaluators deduced proton center-of-mass energies $E_{c.m.}=E(\text{level})(^{36}\text{K})-S(p)(^{36}\text{K})-E(\text{level})(^{35}\text{Ar})$ using their original $S(p)=1666$ 8. Evaluators then deduced each $E(p)_{\text{lab}}=E_{c.m.} \times m(^{35}\text{Ar})/[m(p)+m(^{35}\text{Ar})]$.

[‡] $E(\text{level})(^{36}\text{K})=E(p)_{\text{lab}} \times [m(p)+m(^{35}\text{Ar})]/m(^{35}\text{Ar})+S(p)(^{36}\text{K})+E(\text{level})(^{35}\text{Ar})$, where $S(p)(^{36}\text{K})=1658.9$ 8 ([2021Wa16](#)).
